

Upgradeable Smart Contracts with Interface Support

Before the proxy will work, we need to set the implementation address of it's leached contract, then extend the proxy with the leached contract. (*The implementation address can only be changed as the owner of the proxy contract*)

```
let proxy = await ProxyContract.deployed()
const contractV1 = await ContractV1.deployed()
proxy.upgradeTo(contractV1.address)
proxy = _.extend(proxy, ContractV1.at(proxy.address))
```
